

COMPILE TIME *static — runs before any agent exists*

REJECTED + counterexample → re-draft (human endorses the final G)

RUN TIME *deterministic code, not agents — O(1) per message, zero tokens*

MEASUREMENT *Offline, bit-reproducible*

Deterministic metric engine (no golden trajectory, no LLM judge)

conformance rate · path distribution · goal progress · detour cost · repair burden · S0-S4 severity

Human outcome anchor (sampled)

divergence ⇒ re-draft G with the user,
not patch agents
